To Whom This May Concern:

Your fertility doctor has chosen Clomiphene Citrate as the best treatment option for you. This medication is also known by other names, such as Clomid® or Serophene®. Today you have been provided with compounded Clomiphene Citrate 50mg capsules.

All forms of Clomiphene Citrate contain the same medication at the same dosage, although the shape or appearance may differ. We would like to inform you as to the reasons behind the switch and answer any questions you may have as to the impact this has on your care.

The manufacturers of branded Serophene® and Clomid® tablets have discontinued their production in Canada. As a result, there are no longer any commercially-manufactured options available on the market. To prevent interruption in your care, you will be receiving the same medication in the form of *compounded capsules* that are supplied by PACE Pharmacy.

Compounding is the preparation of a medication by a licensed pharmacist to meet the physician's exact specifications. This is distinct from commercial manufacturing, which involves the mass production of drug products that have been approved by Health Canada.

As this medication is not commercially manufactured, your doctor has instructed us to compound Clomiphene Citrate 50mg capsules from raw materials. We incorporate Clomiphene Citrate, USP with Cellulose, NF as filler into cellulose capsules. Each Clomiphene Citrate 50mg capsule contains 50mg of clomiphene citrate USP, 140mg of Cellulose NF and one capsule shell.

There is no DIN number assigned to this compound as it is custom compounded, and not made commercially.

Yours Truly,

Guihong Teng, RPh
